

# CHROME PLUGIN DEVELOPMENT FOR ENTERPRISE SECURITY

*Optimizing and customizing applications for the success of your company often requires outside help from skilled, professional IT teams who have years of experience working with a variety of business IT enterprise systems and platforms.*

**This client was a large hardware and software** distribution company. The specific project was a Google Chrome plugin development for enterprise security and was directly related to the security product and enterprise mobile application for the cloud development project that we did for them previously.

**Chromebook was slowly getting popular** at the time of the project, and many enterprises were choosing to deploy Chromebooks for some teams in their company. This posed a completely different paradigm from a technology standpoint. Our security products were able to work on Windows laptops, Macbooks and mobile devices - including iOS devices and Android devices, but the Chromebooks were not secured. We thus built a plugin app, which exactly replicated the applications that we built on mobile devices and for the Windows platforms.

**We built the Chrome plugin** via Java, but the OS was actually Android. It's a different version of Android, and though it doesn't behave like a mobile Android app, it's Android and Java. It's a different app altogether. This plugin allowed them to keep their Chromebook devices secured.

---

*Security is one of the most critical business goals. Ensuring that all attack surfaces are covered and that applications are hardened, is a significant way for a business to maintain data integrity and security. Allow the experts to assist your company with optimizing and hardening both your internal hardware and software business IT assets.*
